

LUNG TRANSPLANT CARE

At the USC Transplant Institute, our world-renowned doctors provide advanced, comprehensive care for patients with end-stage cardiopulmonary disease who need a lung transplant.

Lung transplantation is a viable treatment option for patients with end-stage lung disease. Patients eligible for lung transplantation include any person who is severely debilitated by their lung disease and is not hampered by any other organ system dysfunction.

Our experts specialize in safe, successful surgeries to help patients with a wide range of lung diseases. At the USC Transplant Institute, our one-year survival rate post-transplant is better than expected (92.86%) compared to similar patients transplanted in the U.S.* The USC Transplant Institute also offers dual-organ transplantation (Lung-Kidney; Lung-Heart).

We provide integrated care through all stages of transplantation, guiding you through each stage of the lung transplant journey as comfortably, efficiently and seamlessly as possible. Our personalized approach ensures treatment is tailored to your unique needs and goals. We work collaboratively with you every step of the way.

* Updated January 2025. Data from Scientific Registry of Transplant Recipients Program Specific report.
